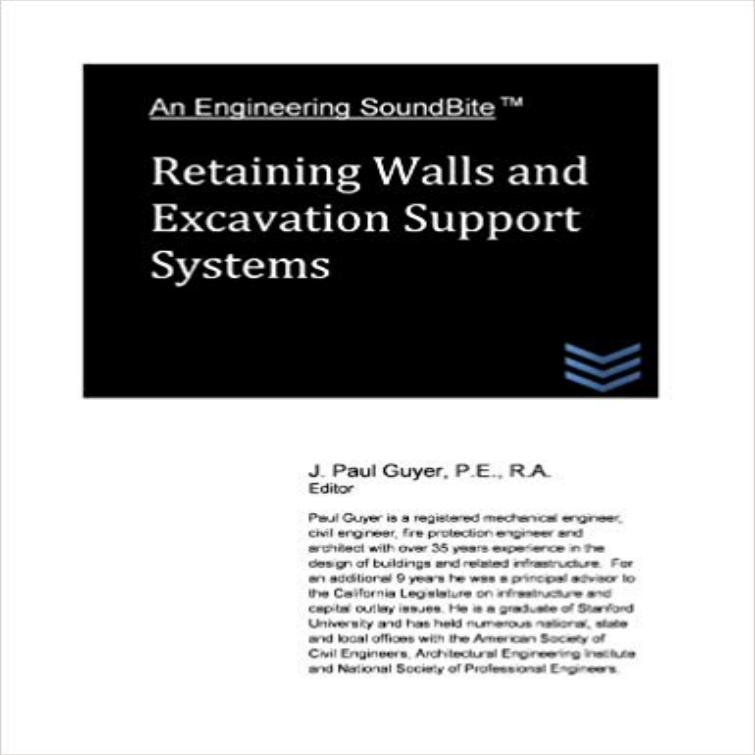
Retaining Walls and Excavation Support Systems (Engineering SoundBites)



This publication discusses analysis and design of retaining walls and excavation support structures. Retaining walls must be designed so that foundation pressures do not exceed allowable bearing pressures, wall settlements are tolerable, safety factors against sliding and overturning are adequate, and the wall possesses adequate structural strength. Methods for evaluating earth pressures on retaining walls and design procedures are summarized for cohesionless backfill materials, which should be used whenever practicable. Topics discussed include earth pressures, equivalent fluid pressures, design procedures for retaining walls, crib walls, excavation support systems, strutted excavations and anchored walls.
