

# Design Sensitivity Analysis of Structural Systems (Mathematics in Science and Engineering)

The book is organized into four chapters. The first three treat distinct types of design variables, and the fourth presents a built-up structure formulation that combines the other three. The first chapter treats finite-dimensional problems, in which the state variable is a finite-dimensional vector of structure displacements and the design parameters. The structural state equations are matrix equations for static response, vibration, and buckling of structures and matrix differential equations for transient dynamic response of structures, which design variables appearing in the coefficient matrices.

Structural design sensitivity analysis concerns the relationship between design variables available to the design engineer and structural responses.
